The physical structure of our deployment diagram stems from the formatting of our application. It starts with a node of the device of the user device itself which has the application artifact on it. From there it has a connection to the internet node and then the information from the servers and the options for the user to work with its account. The artifacts of this node consist of the user search, user messaging, user blocking/ adding and user account editing. These are all primary parts of this node for its software components. It then has a connection to the user information node for storing user information. It has an artifact for the users account information which then has a connection to the user profile artifact.
